## INDEX

## PREFACE

## PART I

### CHAPTER 1: Notations and statement of the problem

- (1.1) The Schrödinger equation
- (1.2) White noise approximation for a free particle: a basic formula
- (1.3) The interaction representation: propagators
- (1.4) The Heisenberg equation
- (1.5) Dynamical systems and their perturbations
- (1.6) Asymptotic behaviour of dynamical systems: the stochastic limit
- (1.7) Slow and fast degrees of freedom
- (1.8) The quantum transport coefficient: why just the  $t/\lambda^2$ -scaling?
- (1.9) Emergence of white noise Hamiltonians equations from the stochastic limit
- (1.10) From interaction to Heisenberg evolutions: conditions on the state
- (1.11) From interaction to Heisenberg evolutions: conditions on the observable
- (1.12) Forward and backward Langevin equations
- (1.13) The open system approach to dissipation and irreversibility: master equation
- (1.14) Classical processes driving quantum phenomena
- (1.15) The basic steps of the stochastic limit

### Complementary material

- (1.16) Connection with the central limit theorems

- (1.17) Classical systems
- (1.18) The backward transport coefficient and the arrow of time
- (1.19) The diagonal master equation: projections onto the diagonal algebra
- (1.20) The master and Fokker–Planck equations: projection techniques
- (1.21) The master equation in open systems: an heuristic derivation
- (1.22) The semi–classical approximation for the master equation
- (1.23) Beyond the master equation
- (1.24) On the meaning of the decomposition  $H = H_o + H_I$ : discrete spectrum
- (1.25) Other rescalings when the time correlations are not integrable
- (1.26) Connections with the classical homogeneization problem
- (1.27) Algebraic formulation of the stochastic limit
- (1.28) Notes
- (1.29) Bibliography

## CHAPTER 2: Quantum fields

- (2.1) Creation and annihilation operators
- (2.2) Gaussianity
- (2.3) Types of Gaussian states: gauge invariant, squeezed, Fock, anti-Fock, . . .
- (2.4) Free evolutions of quantum fields
- (2.5) States invariant under free evolutions
- (2.6) Existence of squeezed stationary fields
- (2.7) Positivity of the covariance
- (2.8) Dynamical systems in equilibrium: the KMS condition
- (2.9) Equilibrium states: the KMS condition
- (2.10)  $q$ -Gaussian equilibrium states
- (2.11) Boson Gaussianity
- (2.12) Boson Fock fields
- (2.13) Free Hamiltonians for Boson Fock fields

- (2.14) White noises
- (2.15) Boson Fock white noises and classical white noises
- (2.16) Boson Fock white noises and classical Wiener processes
- (2.17) Boson thermal statistics and thermal white noises
- (2.18) Canonical representation of the thermal states

#### **Complementary material**

- (2.19) Spectral representation of the  $Q$  - white noise
- (2.20) Locality of quantum fields and ultralocality of quantum white noises
- (2.21) Notes
- (2.22) Bibliography

### **CHAPTER 3: Those kind of fields we call noises**

- (3.1) Convergence of fields in the sense of correlators
- (3.2) Generalized white noises as stochastic limit of Gaussian fields
- (3.3) Existence of Fock, temperature and squeezed white noises
- (3.4) Convergence of the field operators to a classical white noise

#### **Complementary material**

- (3.5) Beyond the master equation: the master field
- (3.6) Discrete spectrum embedded into the continuum
- (3.7) The stochastic limit of a classical Gaussian random field
- (3.8) Semi-classical versus semi-quantum approximation
- (3.9) An historical example: the damped harmonic oscillator
- (3.10) Emergence of the white noise: a traditional derivation
- (3.11) Heuristic origins of the QWN
- (3.12) Relativistic quantum white noises
- (3.13) Space-time rescalings: multidimensional white noises

- (3.14) The chronological stochastic limit
- (3.15) Notes
- (3.16) Bibliography

#### **CHAPTER 4: A simple linear model**

- (4.1) A linear Hamiltonian
- (4.2) Naturality of the Friedrichs–van Hove scaling
- (4.3) Emergence of the collective fields: the master field
- (4.4) The scattering operator in the linear model
- (4.5) The stochastic differential equation

#### **CHAPTER 5: Open systems**

- (5.1) The non relativistic QED Hamiltonian
- (5.2) The dipole approximation
- (5.3) The rotating wave approximation
- (5.4) Composite systems
- (5.5) Assumptions on the environment (field, gas, reservoir,...)
- (5.6) Assumptions on the system Hamiltonian
- (5.7) The free Hamiltonian
- (5.8) Multiplicative interactions: canonical form
- (5.9) Approximations of the multiplicative Hamiltonian
- (5.10) The generalized rotating wave approximation
- (5.11) The stochastic limit of the multiplicative interaction
- (5.12) The normal form of the white noise Hamiltonian equation
- (5.13) Invariance of the Ito correction term under the free system evolution
- (5.14) The stochastic golden rule: Langevin and master equations
- (5.15) Classical stochastic processes underlying quantum processes

- (5.16) The fluctuation-dissipation relation
- (5.17) Vacuum transition amplitudes
- (5.18) Mass gap of  $D^+D$  and speed of decay
- (5.19) How to avoid decoherence
- (5.20) The energy shell scalar product: linewidths
- (5.21) Dispersion relations and the Ito correction term
- (5.22) The case:  $H_1 = k^2$
- (5.23) Multiplicative coupling with RWA: arbitrary gaussian state
- (5.24) Multiplicative coupling with RWA: gauge invariant state
- (5.25) Red shifts and blue shifts
- (5.26) The free evolution of the master field
- (5.27) Algebras invariant under the flow
- (5.28) System algebras invariant under the flow
- (5.29) Notes
- (5.30) Bibliography

## **CHAPTER 6: The Stochastic Resonance Principle**

- (6.1) Dropping the rotating wave approximation
- (6.2) The master field and the stochastic resonance principle
- (6.3) The white noise Hamiltonian equation
- (6.4) The operator transport coefficient in absence of RWA
- (6.5) Symmetry breaking between positive and negative Bohr frequencies
- (6.6) No rotating wave approximation with cut-off: equilibrium states
- (6.7) No rotating wave approximation with cut-off: squeezing states
- (6.8) The stochastic golden rule versus standard perturbation theory
- (6.9) Spin-Boson Hamiltonians
- (6.10) A Cheshire Cat Effect: Fock case
- (6.11) A Cheshire Cat Effect: non-zero temperature

- (6.12) No rotating wave approximation without cut-off
- (6.13) The drift term for gauge invariant states
- (6.14) The free evolution of the master field
- (6.15) The stochastic limit of the spin-boson Hamiltonian
- (6.16) The Langevin equation
- (6.17) Convergence to equilibrium
- (6.18) Control of coherence
- (6.19) Dynamics of spin systems

### **Complementary material**

- (6.20) Non stationary white noises
- (6.21) Notes
- (6.22) Bibliography

### **CHAPTER 7: Measurements and filtering theory**

- (7.1) Input-Output channels
- (7.2) The filtering problem in classical probability
- (7.3) Field measurements
- (7.4) Properties of the input and output processes
- (7.5) The filtering problem in quantum theory
- (7.6) Filtering of a quantum system over a classical process
- (7.7) Non demolition processes
- (7.8) Standard scheme to construct examples of non-demolition measurements
- (7.9) Discrete time non demolition processes
- (7.10) Notes
- (7.11) Bibliography

### **CHAPTER 8: Idea of the proof and causal normal order**

- (8.1) Term by term convergence of the series
- (8.2) Vacuum transition amplitude: the fourth order term
- (8.3) Vacuum transition amplitude: non time consecutive diagrams
- (8.4) The causal  $\delta$ -function and the time consecutive principle
- (8.5) Theory of distributions on the standard simplex
- (8.6) The second order term of the limit vacuum amplitude
- (8.7) The fourth order term of the limit vacuum amplitude
- (8.8) Higher order terms of the vacuum–vacuum amplitude
- (8.9) Proof of the normal form of the white noise Hamiltonian equation
- (8.10) The unitarity condition for the limit equation
- (8.11) Normal form of the thermal white noise equation: Boson case
- (8.12) From white noise calculus to stochastic calculus
- (8.13) Notes
- (8.14) Bibliography

## **CHAPTER 9: Chronological product approach to the stochastic limit**

- (9.1) Chronological products
- (9.2) Chronological product approach to the stochastic limit
- (9.3) The limit of the  $n$ -th term, time–ordered product approach: vacuum expectation
- (9.4) The stochastic limit, time–ordered product approach: general case

## **CHAPTER 10: Functional integral approach to the stochastic limit**

- (10.1) Statement of the problem
- (10.2) The stochastic limit of the free massive scalar field
- (10.3) The stochastic limit of the free massless scalar field
- (10.4) Polynomial interactions
- (10.5) The stochastic limit of the electromagnetic field
- (10.6) Feynman functional integrals
- (10.7) Hamiltonian and Lagrangian formalism
- (10.8) Finite dimensional Feynman Functional Integral
- (10.9) Euclidean functional integrals
- (10.10) Feynman Functional Integral: Rigorous Definition
- (10.11) Feynman functional integral for free fields
- (10.12) Bibliography

## **CHAPTER 11: Low density limit: basic idea**

- (11.1) The low density limit: Fock case, no system
- (11.2) The low density limit: Fock case, arbitrary system,  $\omega = 0$
- (11.3) Comparison of the distribution and the stochastic approach
- (11.4) LDL general, Fock case, no system,  $\omega = 0$
- (11.5) Notes
- (11.6) Bibliography

## **CHAPTER 12: Six basic principles of the stochastic limit**

- (12.1) Polynomial interactions with cut-off
- (12.2) Assumptions on the dynamics: standard models
- (12.3) Polynomial interactions: canonical forms, Fock case

- (12.4) Polynomial interactions: canonical forms, gauge invariant case
- (12.5) The stochastic universality class principle
- (12.6) The case of many independent fields
- (12.7) The block principle: Fock case
- (12.8) The stochastic resonance principle
- (12.9) The orthogonalization principle
- (12.10) The stochastic bosonization principle
- (12.11) The time-consecutive principle
- (12.12) Stochastic golden rule for polynomial interactions: Boson, Fock
- (12.13) Stochastic golden rule for polynomial interactions: Fermion, Fock
- (12.14) Stochastic golden rule for polynomial interactions: Boson, temperature
- (12.15) Stochastic golden rule for polynomial interactions: Fermion, temperature. A simple example
- (12.16) Stochastic golden rule for polynomial interactions: Fermion, temperature.
- (12.17) The unitarity condition
- (12.18) Notes
- (12.19) Bibliography

## PART II

### STRONGLY NONLINEAR REGIMES

#### CHAPTER 13: Particles interacting with a Bose field.

- (13.1) A single particle interacting with a Boson field
- (13.2) Dynamical  $q$ -deformation
- (13.3) The 2-point and 4-point correlators
- (13.4) The stochastic limit of  $N$ -point correlator
- (13.5) The  $q$ -deformed module Wick theorem
- (13.6) The Wick theorem for the QED module

- (13.7) The limit equation
- (13.8) Free independence of the increments of the master field
- (13.9) Hamiltonian evolution equations driven by Boltzmannian white noises
- (13.10) Unitarity property of the evolution operator
- (13.11) Matrix elements of  $U_t$
- (13.12) The Hamiltonian equation for the QED module
- (13.13) Module unitarity of the limit evolution operator  $U_t$
- (13.14) Matrix elements of the limit evolution operator: module case
- (13.15) Non exponential decays
- (13.16) Equilibrium states
- (13.17) The master field
- (13.18) Proof of the result for the 2- and 4-point correlators
- (13.19) The vanishing of the crossing diagrams
- (13.20) The hot free algebra

#### **CHAPTER 14: Particles interacting with a Fermi field**

- (14.1) The Anderson model

## CHAPTER 15: Field–Field interactions

- (15.0) Interacting Commutation Relations
- (15.1) The tri-linear Hamiltonian with momentum conservation
- (15.2) Proof of the Theorem
- (15.3) Example: four internal lines
- (15.4) The stochastic limit for Green functions
- (15.5) Second quantized representation of the non-relativistic QED Hamiltonian
- (15.6) Interacting commutation relations and non-relativistic QED module algebra
- (15.7) Decay and the universality class of the QED Hamiltonian
- (15.8) Photon splitting cascades and a new statistics
- (15.9) Bibliography

## PART III

### ESTIMATES AND PROOFS

#### CHAPTER 16: Analytical theory of Feymann diagrams

- (16.1) The connected component theorem
- (16.2) The factorization theorem
- (16.3) The case of many independent fields
- (16.4) The Fermi Block Theorem
- (16.5) Non time-consecutive terms: first vanishing theorem
- (16.6) Non time consecutive terms: second vanishing theorem
- (16.7) The type I term theorem
- (16.8) The double integral lemma
- (16.9) The multiple-simplex theorem
- (16.10) The multiple integral lemma
- (16.11) The second multiple-simplex theorem

- (16.12) Notes
- (16.13) Bibliography

### **CHAPTER 17: Term by term convergence**

- (17.1) Universality Class Principle and effective interaction Hamiltonian
- (17.2) Block and orthogonalization principles
- (17.3) The stochastic resonance principle
- (17.4) The master space: Vacuum Bose case
- (17.5) The master space: Vacuum Fermi case
- (17.6) The master space: finite temperature Bose
- (17.7) The master space: finite temperature Fermi
- (17.8) Time-consecutive principle: negligible terms
- (17.9) The term by term limit: surviving terms
- (17.10) Bibliography

### **CHAPTER 18: The limit stochastic differential equation**

- (18.0) The limit stochastic differential equation
- (18.1) The limit of  $X_{+,t/\lambda^2}$ : Boson case
- (18.2) The limit of  $U_{t/\lambda^2}$ : Boson case
- (18.3) The limit of  $X_{-,t/\lambda^2}$ : Boson case
- (18.4) The limit of  $X_{+,t/\lambda^2}$ : Fermion case
- (18.5) The limits of  $U_{t/\lambda^2}$  and  $X_{-,t/\lambda^2}$ : Fermion case
- (18.6) Bibliography

### **CHAPTER 19: The uniform estimate and the unitarity**

- (19.1) The unitarity of the limit processes: Bose case
- (19.2) The unitarity of the limit processes: Fermion case

(19.3) The exchangeability between and limit of  $\lambda \rightarrow 0$  and the sum in the expansion of the evolution operator

(19.4) Bibliography

## **CHAPTER 20: Collective vectors and quantum convergence in law**

(20.1) Collective vectors

(20.2) Convergence in law: classical case

(20.3) Convergence in law: quantum case

(20.4) The completeness of the collective vectors

(20.5) Bibliography

## **CHAPTER 21: Basic ideas of stochastic calculus**

(21.1) Ito stochastic calculus

(21.2) Ito formula and Ito table

(21.3) An equivalent definition of Boson Fock space

(21.4) Wiener–Ito Chaos decomposition

(21.5) Bibliography
