Early developments in monumental architecture

Gabriele Cifani

MICHAEL L. THOMAS and GRETCHEN E. MEYERS (edd.), afterword by I. E. M. Edlund-Berry, *MONUMENTALITY IN ETRUSCAN AND EARLY ROMAN ARCHITECTURE: IDEOLOGY AND INNOVATION* (University of Texas Press, Austin 2012). Pp. xi + 184, figs. 58, tables. ISBN 978-0-292-73888-1. \$60.

This interesting collection of papers was planned for the 2009 annual meeting of the Archaeological Institute of America to honor the Etruscologist I. Edlund-Berry. In the central Tyrrhenian area, monumentality is the *fil rouge* linking experiences of architecture from the Orientalizing phase to the Middle Republic.

G. E. Meyers introduces the concept by recalling the etymology of the word from the Latin noun *monumentum*, deriving from the verb *moneo* ('to bring to the notice of, remind, warn') and citing examples of works defined as *monumenta* in Latin literature (e.g., Liv., Pref. 6-10; Cic., *ad Att.* 4.16.8), which often emphasize the display of expenditure in building and their rôle in the transmission of public memory. According to her (2), among the first examples of monumental building in Etruria we can cite the huge orientaling tumulus of *Caere* and then the *palazzi*, the huge Late Orientalizing and Archaic courtyard-buildings found first at Poggio Civitate (Murlo) and later at Acquarossa and Satricum. It could have been useful to consider also the debate on the possible presence of monumental burials in central Tyrrhenian Italy already in the Middle and Late Bronze Ages — see, for instance, a megalithic chamber tomb at *Civitella Cesi*¹ — and to consider the rôle played during the Early Orientalizing period by Near Eastern models or even architects and stone-carvers in order to explain the rapid spread of monumental *tumuli* in Etruria and Latium.²

Etruscan studies (and especially Italian scholars) rarely make use of ethnography, but, in an interesting paper on the early architecture of Latium ("Straw to stone, huts to houses"), E. Colantoni makes careful use of ethnographic data (mainly from African tribal societies) to provide statistics and parallels for investigating the nature of early housing in ancient Latium (e.g., regarding the number of people possibly accommodated inside a hut, and possible correlations between clusters of huts). Still, one should emphasize (and not merely as a matter of terminology) that the frequent use of the term "huts" for the Early Iron Age structures is no longer appropriate. Research over the last three decades on settlements and architecture shows that dwellings of Early Latium were characterized by the use of an impressive number of trees, clay plaster, thick thatched roofs, and a complex system of rock-cut external drains for removing rainfall. Plainly these were permanent buildings within the fortified, often urbanized settlements which comprised the main centers of Middle Tyrrhenian Italy in the Early Iron Age. Thus I believe one should more properly adopt the terms "wooden houses" or "wooden structures" instead of the rather primitivist "huts".

A. Tuck ("The performance of death: monumentality, burial practice, and community identity in central Italy's urbanizing period") offers a discussion of monumental burial practices at Tarquinia, Caere and Chiusi. N. A. Winter discusses the evidence of mouldings in the architecture of Archaic buildings at Rome, Tarquinii, Caprifico, Veii and Vetulonia at the end of the 7th and throughout the 6th c. Her careful analysis reveals the widespread distribution of monumental architecture as a common language among urban Etruscan and Latin communities. P. G. Warden ("Monumental embodiment: somatic symbolism and the Tuscan temple") focuses on Etruscan archaic temple architecture and its possible relationship with the representation of the human form.

Figs. 2-3. Plan of the remains of the Temple of Jupiter Capitolinus and hypothetical reconstruction according to the reviewer (G. Cifani, *Architettura romana arcaica* [Rome 2008]).

J. N. Hopkins focuses on the temple of Jupiter Capitolinus built in the last phase of the monarchy at Rome. He offers an interesting, up-to-date summary of the debate on the reconstruction of the temple, opting for the model known from the literary sources and correctly reconstructed already by E. Gjerstad,³ as confirmed by the excavation carried out at the end of the 1990s.⁴ He correctly proposes to imagine a trussed wooden roof to cover the temple's huge intercolumnial distances, and he confirms the influence of Ionic architecture on its plan. However, he also proposes a plan of the temple with four rooms behind the three *cellae* (fig. 6.5, p. 117 = fig. 1 here; repeated in fig. 6.8 and in fig. 7.4 of the following paper). In my opinion, this hypothesis is unrealistic because it is based on very uncertain remains of two or three fragments of walls behind the podium (for a more detailed plan of the temple see fig. 2 here) which can be more easily interpreted as links between the temple's podium and the retaining walls of the NW slope of the Capitoline toward the Campus Martius (illustrated by figs. 3 and 4 here). In addition, such a "four room hypothesis" not only denies the validity of the precise description offered by Dionysius of Halicarnassus (4.61.3-4), but is also contradicted by the model adopted for the

many *capitolia* known from Italy and N Africa, the plans of which always reveal the absence of any spaces or rooms behind the *cellae*.⁵

P. J. E. Davies hypothesizes the presence of stone entablatures in Rome's temples already during the course of the 3rd c. B.C., as possibly indicated by the narrow intercolumniations of the earliest phases of the Temple of Victory on the Palatine, the Temple of Portunus, and Temple of A in the Area sacra di Largo Argentina. According to her (146), the material used for stone entablatures could have been the grey lithoid tufa known as *peperino* (ancient *lapis albanus* and *lapis gabinus*). This stimulating hypothesis is not incompatible with the general assumption that the use of wooden trabeation, above all for private and domestic buildings, would have remained widespread at Rome until the advent of concrete. In addition, it could suggest a further stage in the Hellenization of Roman architecture a full century before the urban and architectural revolution that followed upon the conquest of mainland Greece in the mid-2nd c. B.C. Yet such an hypothesis also remains problematic for a number of reasons. Not only does it lack any direct evidence, but it requires further research on how such buildings are to be reconstructed, as well as on their exact chronologies, which in many cases remain controversial and are too often based on the literary traditions.⁶ The very idea of the use of *peperino* for stone entablatures is problematic: in the mid-Republican phase this kind of stone was used mainly for squared blocks, sarcophagi and altars, but it is not attested as architraves to cover huge intercolumnial distances.⁷ The friability and technical qualities of this

⁵ J. Crawley Quinn and A. Wilson, "Capitolia," *JRS* 103 (2013) 117-73.

⁶ E.g., for a discussion of the chronology of the temple of Portunus: G. Del Buono, "Il tempio di Portuno: una nuova periodizzazione per le fasi medio-repubblicane," *BullCom* 110 (2009) 9-30, with bibliography.

⁷ For a list, see E. Blake, *Ancient Roman construction in Italy from the prehistoric period to Augustus* (Washington, D.C. 1947) 34-39; G. Lugli, *La tecnica edilizia romana* (Rome 1957) 302-9.

kind of stone, which was formed from volcanic ash, made it an excellent material for walls, foundations, arches and mouldings, but less suitable for architraves, especially when compared to travertines and marbles, the widespread use of which really marks the first appearance of stone entablatures in Roman architecture. A much later and quite exceptional example could be the monumental Doric *porticus* of the Late Republican phase of the sanctuary of Diana at Nemi, where, to cover intercolumnial distances of c.2 m (interaxial distances of c.2.7 m), an impressive *peperino* architrave 1.8 m high was laid on *opus mixtum* columns with diameters of 0.85 m.⁸ For these reasons, the hypothetical narrow intercolumniations, as reconstructed for the mid-Republican temples mentioned above, should continue to be viewed as a late adoption of Classical Greek temple modules, while the entablature could have remained in wood, as it was in the Archaic buildings.⁹

An afterword by Edlund-Berry emphasizes the importance of studying monumentality of buildings in their original urban location and in the context of their setting in the landscape.

Overall, the collection offers new ideas, especially on the political struggles fought by the élite and on their self-representation through the medium of public and private architecture over a period of four centuries. Above all, the book challenges the traditional and ethnocentric notion of separate developments in architecture between Romans and Etruscans during the Archaic period.

The final report on the Veii survey by the BSR

Angela Murock Hussein

ROBERTA CASCINO, HELGA DI GIUSEPPE and HELEN L. PATTERSON (edd.), with contributions by A. Bousquet, R. Cascino, W. Clarke, M. Craven, F. Del Vecchio, F. Di Gennaro, H. Di Giuseppe, M. T. Di Sarcina, F. Felici, S. Fontana, A. Kirk, H. L. Patterson, C. Phillips, M. Rendeli, M. Sansoni, A. Schiappelli, C. J. Smith, D. Williams, R. Witcher and S. Zampini, *VEII. THE HISTORICAL TOPOGRAPHY OF THE ANCIENT CITY. A RESTUDY OF JOHN WARD-PERKINS' SURVEY* (Archaeological Monograph of the British School at Rome 19, London 2012; distributed by Oxbow Books). Pp. xiii + 431, figs. 141, colour pls. 2, Tables. ISBN 978-0-904152-63-0. £85.

The British School at Rome has now delivered the final report on its field survey around the Etruscan city of Veii, a long-awaited follow-up to the initial report of 1961.¹ The work at Veii was one section of the South Etruria Survey, begun 60 years ago by the British School at Rome under the direction of J. B. Ward-Perkins² and continuing until his retirement in 1974, although the School's work in the region has gone on to be incorporated into the expansive Tiber Valley Project.³
